## ABSTRACT

A server radiator includes a radiator fan, a frame and a case. The frame holds the radiator fan and has a latch element. The case has a housing compartment, which has an opening directed toward and exposed outside the case, and an exposed opening corresponding to the latch element. The frame may be inserted in the housing compartment from outside of the case, and the latch element may be engaged with the exposed opening. The latch element also may be moved away from the exposed opening to allow the frame to be removed from the housing compartment, thereby accomplishing maintenance without opening the case and saving replacement time.
